Systems Module

The Systems module reduces the time needed to find tail-specific technical information in time-critical situations, such as line maintenance troubleshooting and dispatch.

A Visual Gateway to Critical Technical Information

The Systems module provides you with the ability to:

- Enhance your airplane system knowledge and retention with airplane system diagrams (synoptics) that provide both a "mental model" of a particular system and a graphical interface to retrieve line replaceable unit (LRU)-specific information

- Link from synoptics or LRU lists to find maintenance procedures, troubleshooting information, parts data, wiring diagrams or maintenance tips associated with a selected LRU

- Easily search using effectivity filtering for all relevant information related to a maintenance message, fault code or troubleshooting path

- Enter a part number and go directly to the applicable part information in the Aircraft Illustrated Parts Catalog

Key benefits

- Improved troubleshooting and fault isolation through advanced systems knowledge

- Faster, more accurate research across your Maintenance Library

- Improved operational performance and safety

- Faster, more accurate research across all documents

- Collaborative troubleshooting

Key notes

- Requires the Library module
